

Software Tools and Services for chrono and psycho physiology

PRANA Profiler

Profiler is a toolbox specially designed to explore and process multiple time series. The software features various 2-D or 3-D data representation modes and offers several data post-processing, selection, sorting and exporting options.

The software automatically recognizes every PRANA® software analyses files. It also supports importing time series from external softwares according to various digital file format (text and binary).

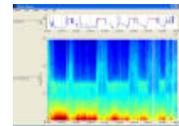

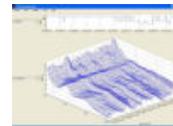

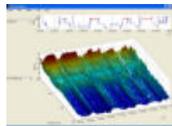

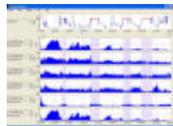

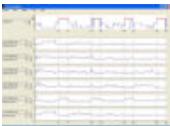

The software import functions allows to merge and compare data from other applications.

Profiler offers various tools for sorting data according to sleep stages, computing new parameters from existing ones, transforming and re-sampling time series.

Explore and prepare data for statistical analysis using the Profiler temporal or frequency smoothing and reduction functions.
